

# What happens to people with T2DM on o.d. glargine insulin and tablets?

Ian Gallen

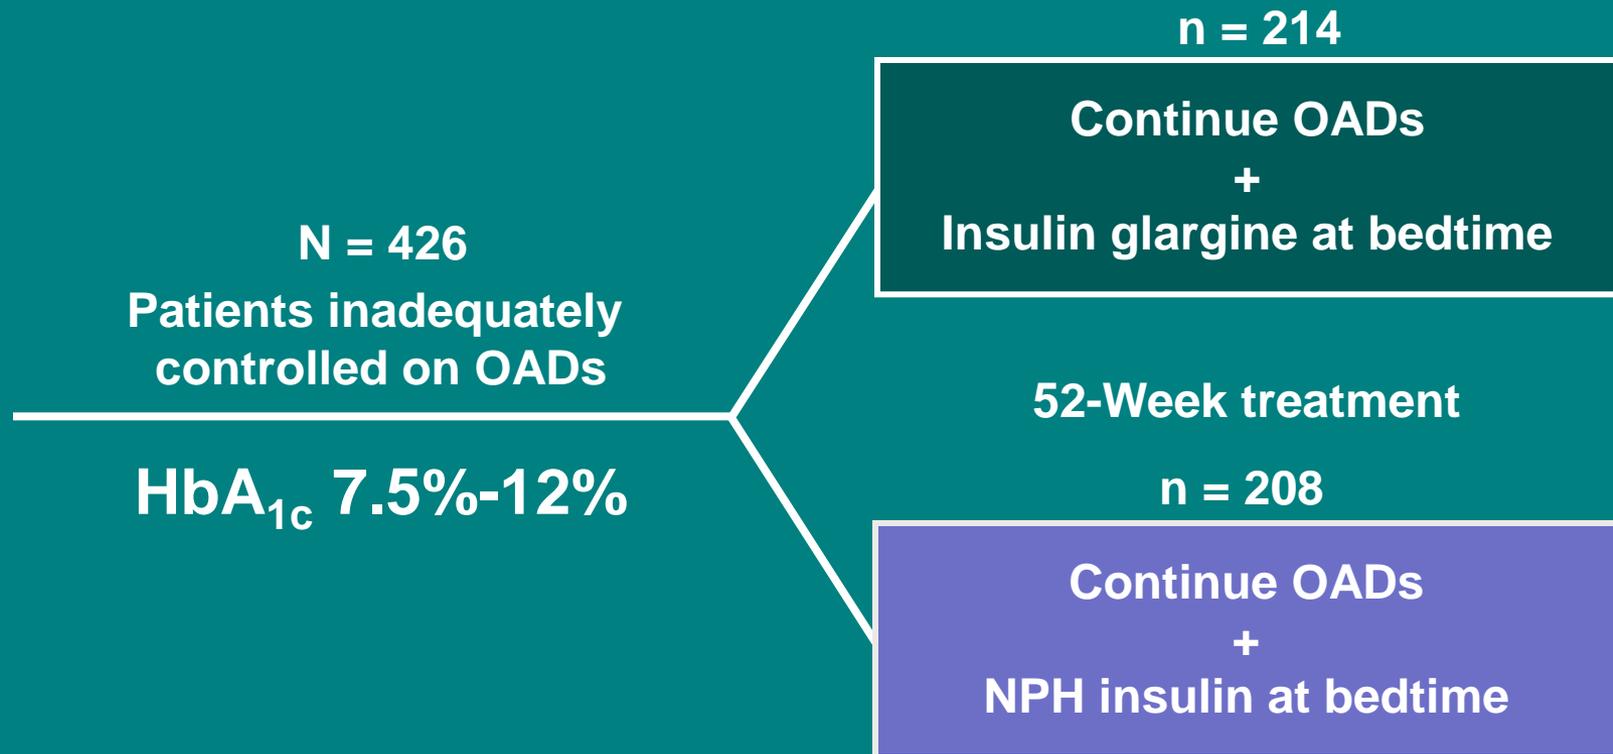

# Glycaemic control in Buckinghamshire

## Mean HbA1c by GP Practice 2004

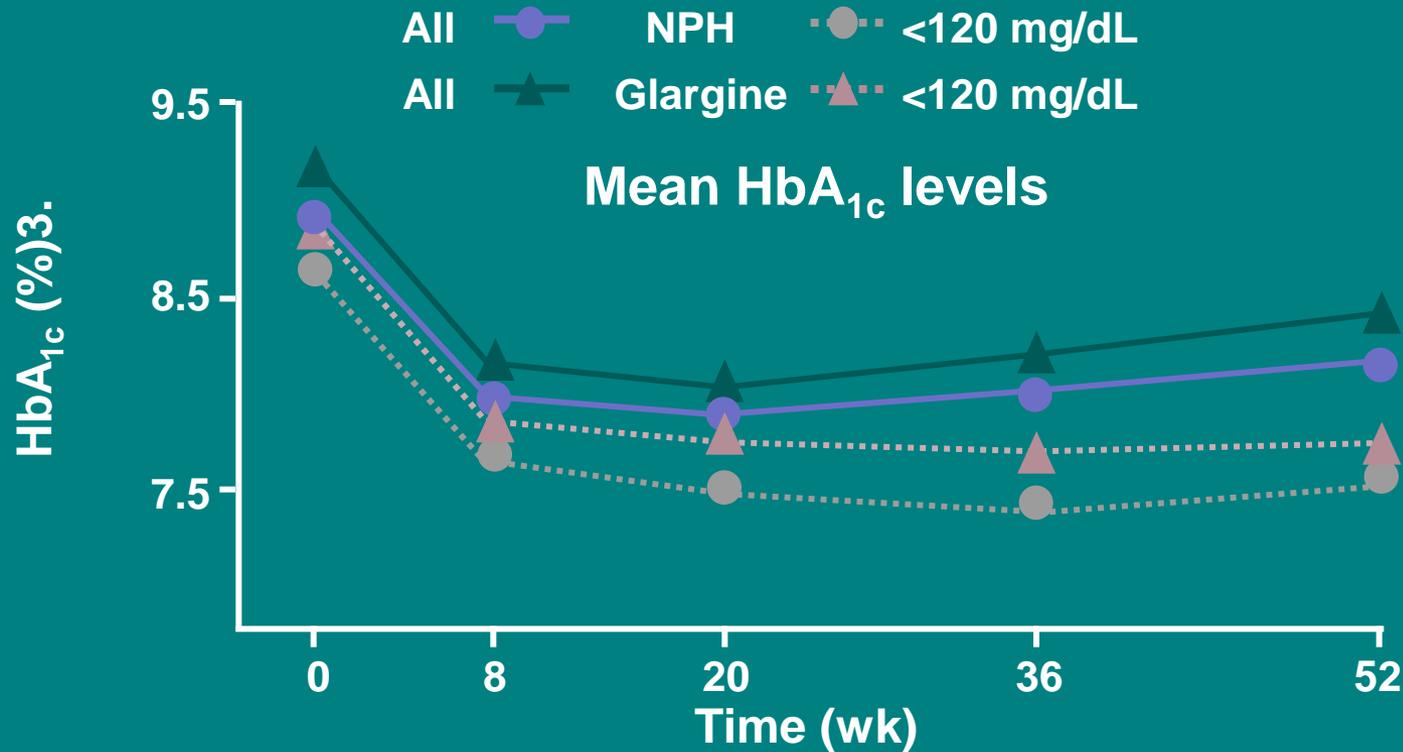

# Insulin Glargine vs NPH Insulin Added to Oral Therapy

Target FBG:  $\leq 120$  mg/dL ( $\leq 6.7$  mmol/L)  
Equivalent to FPG  $\leq 135$  mg/dL ( $\leq 7.5$  mmol/L)

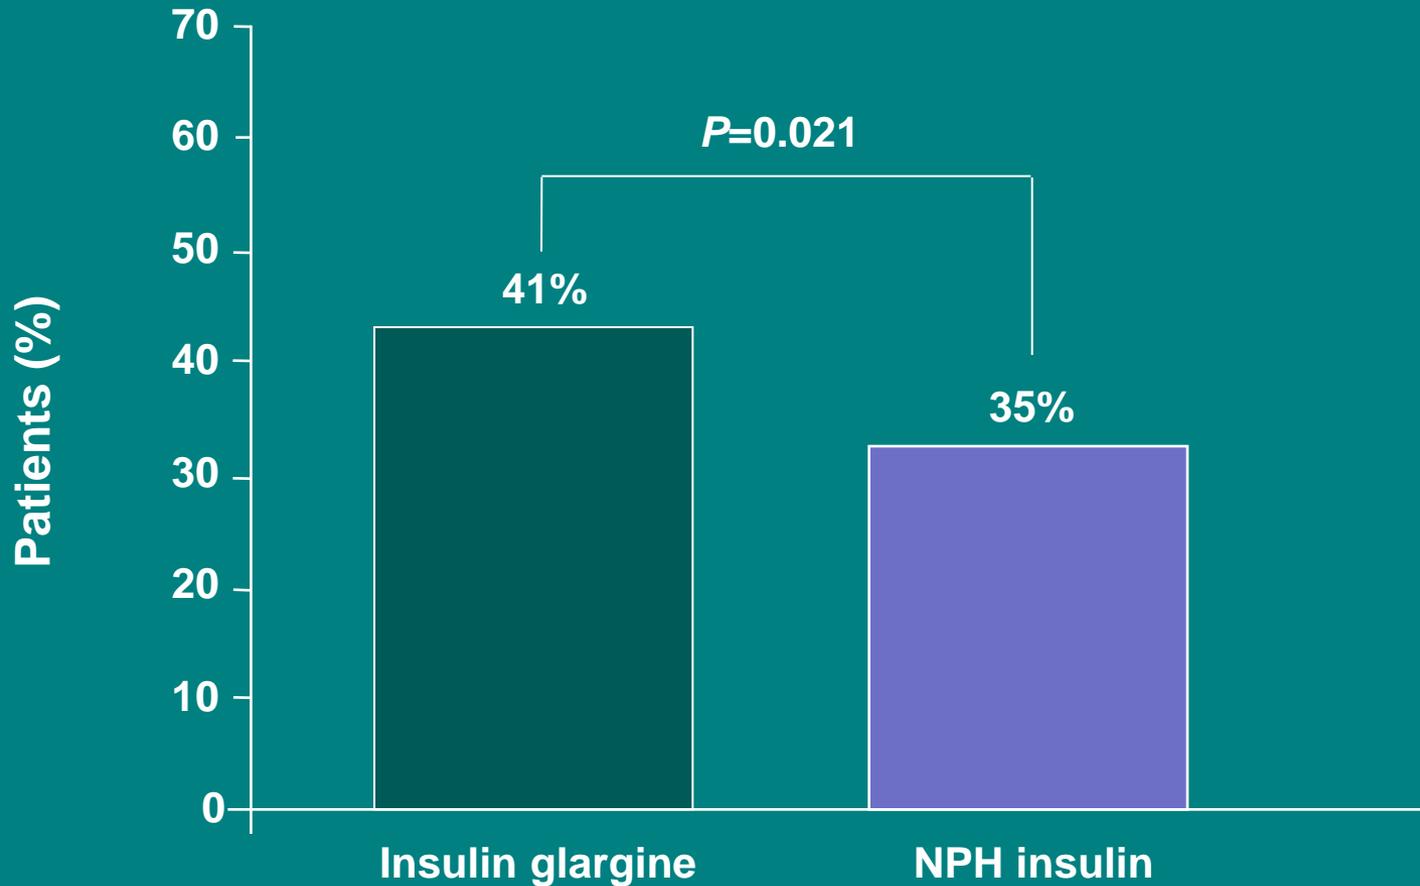

# Insulin Glargine vs NPH Insulin Added to Oral Therapy

Target FBG:  $\leq 6.7$  mmol/L

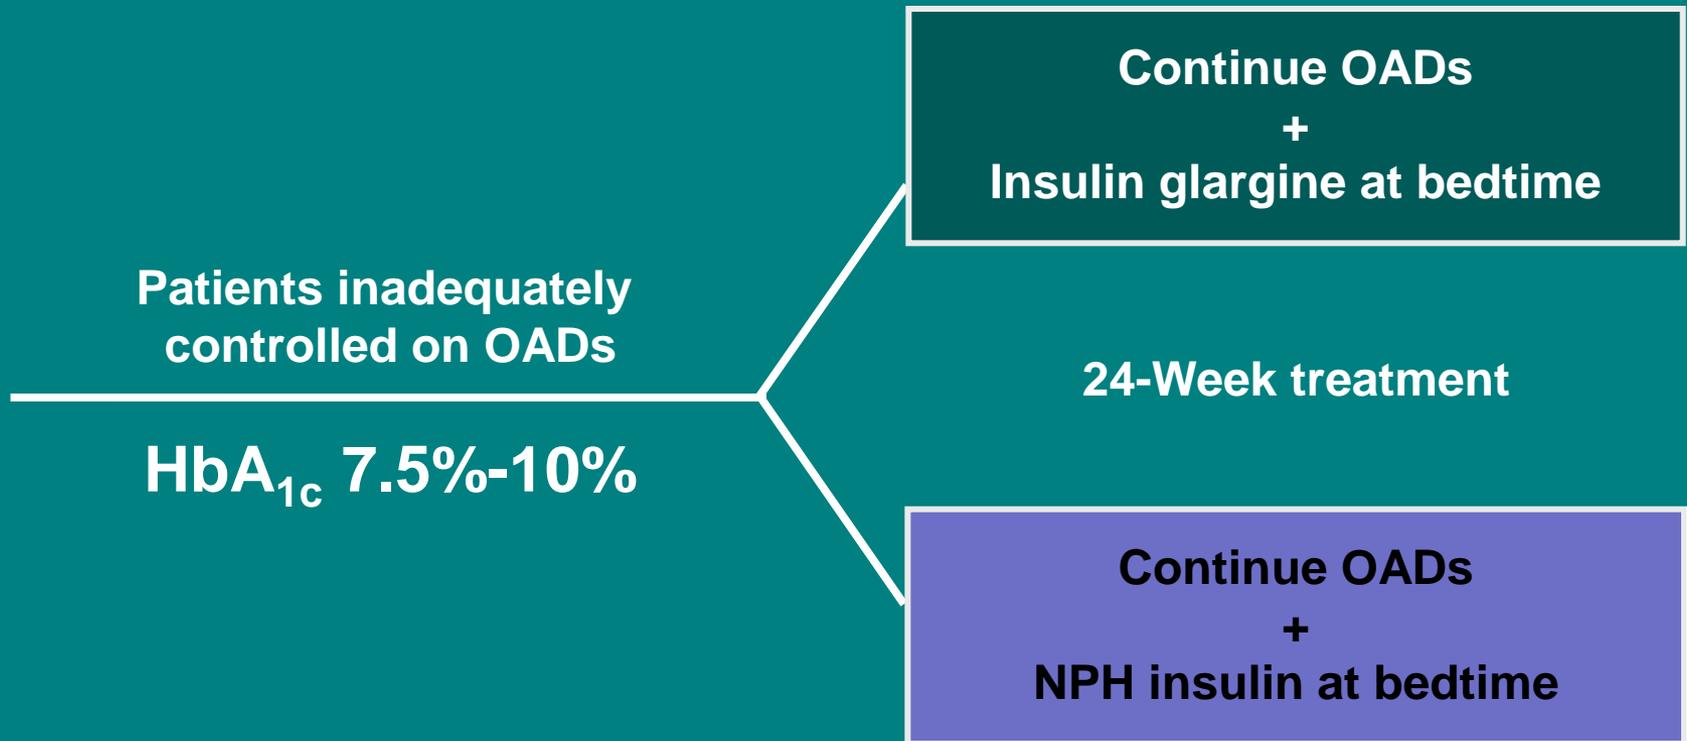

# Patients with T2DM with FBG $\leq 6.7$ mmol/L at 52 Weeks With Insulin Glargine vs NPH Insulin

# Treat-to-Target Trial in T2DM

Target FPG:  $\leq 100$  mg/dL ( $\leq 5.5$  mmol/L)

# Treat-to-Target Trial Methods: Forced-Titration Schedule

**Start With 10 IU/d Bedtime Basal Insulin and Adjust Weekly**

<b>Self-monitored FPG (mg/dL)*</b>	<b>↑ Insulin Dose (IU/d)†</b>
<b>&gt;180</b>	<b>8</b>
<b>140-180</b>	<b>6</b>
<b>120-140</b>	<b>4</b>
<b>100-120</b>	<b>2</b>

**Treat-to-Target  $\leq 100$  mg/dL ( $\leq 5.6$  mmol/L)**

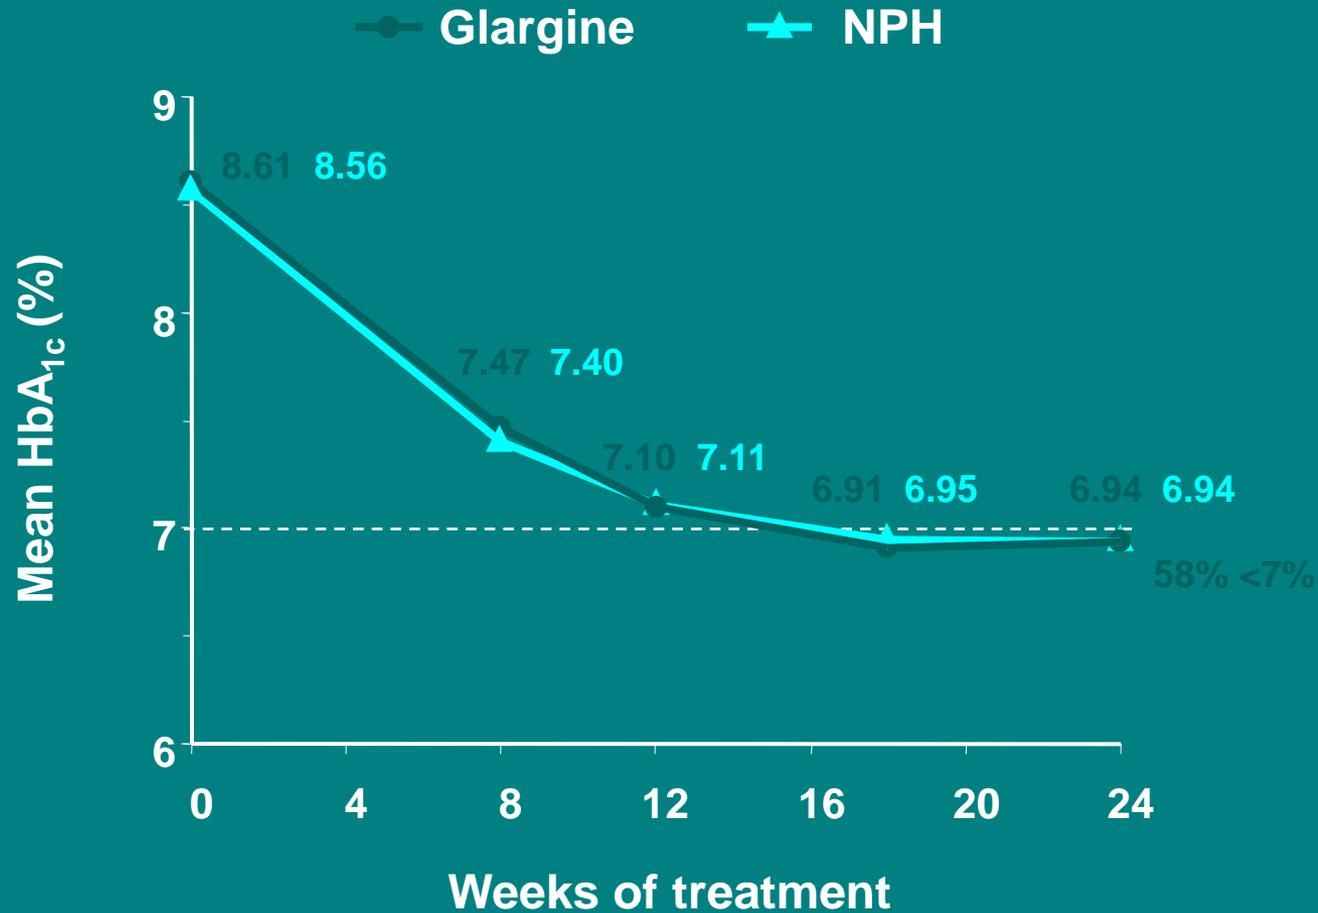

\*Measurements were from 2 preceding days; no increase in dosage if PG  $\leq 72$  mg/dL ( $\leq 4.0$  mmol/L) was documented at any time in preceding week.

†Small decrease (2-4 IU/d) in dosage allowed if self-monitored PG  $< 56$  mg/dL ( $< 3.1$  mmol/L) or severe hypoglycaemia occurs.

FPG=fasting plasma glucose; PG=plasma glucose.

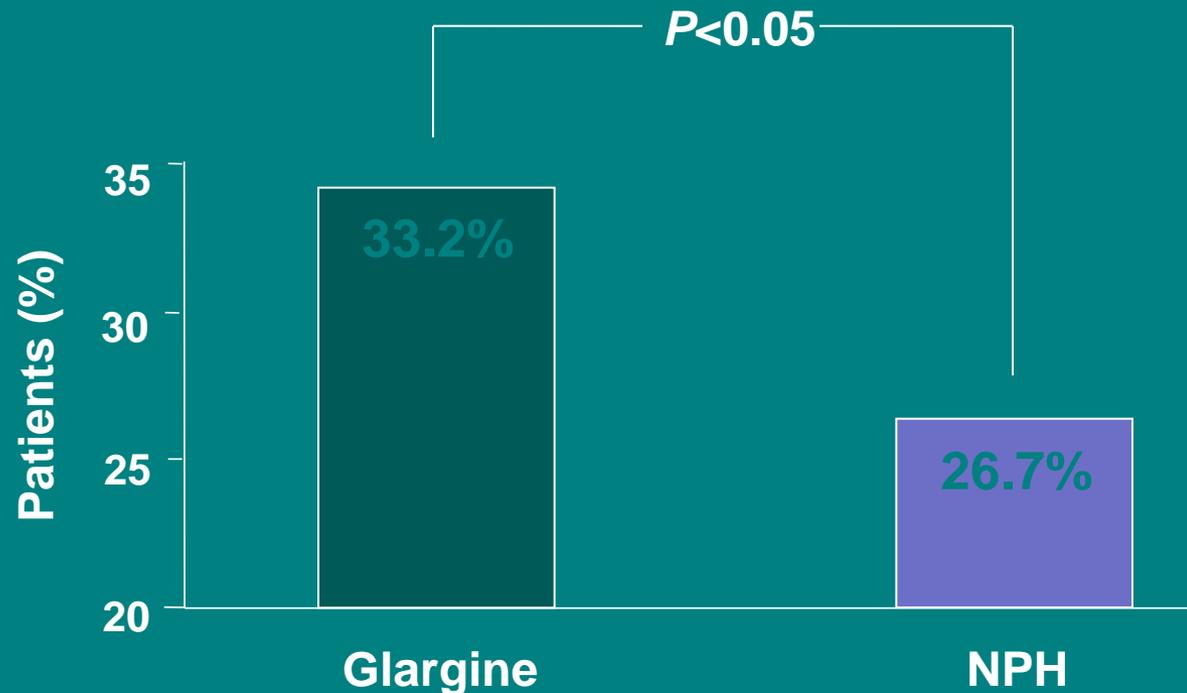

Adapted, with permission, from Riddle M et al. *Diabetes Care*. 2003;26:3080-3086.

# Mean HbA<sub>1c</sub> with Insulin Glargine and NPH Insulin

# Treat-to-Target Trial in T2DM: Results

33% of Patients Achieve Target HbA<sub>1c</sub> ≤7%, Without Documented Nocturnal Hypoglycaemia (PG ≤72 mg/dL [4.0 mmol/L]), With Insulin Glargine

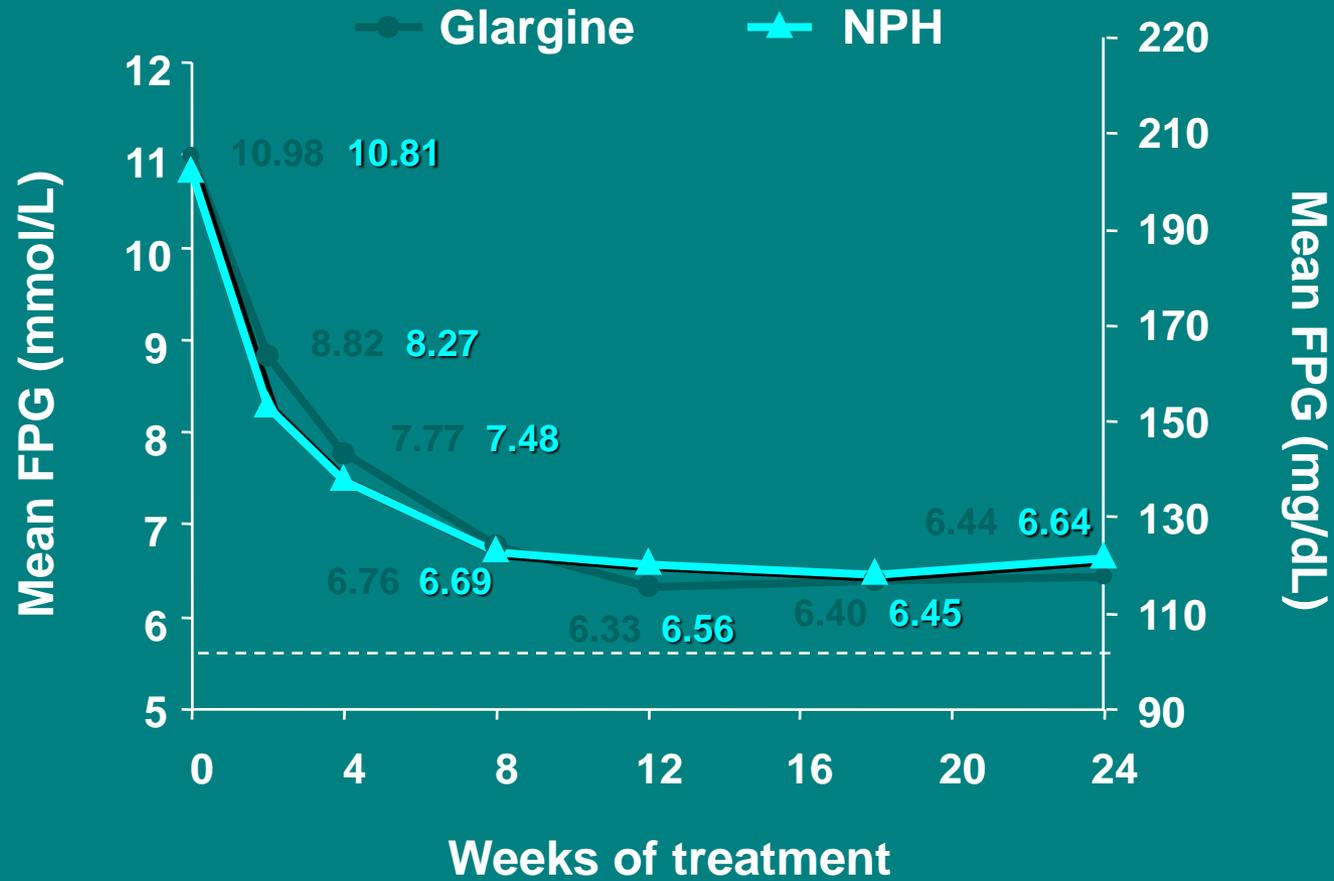

Intent-to-treat analysis.

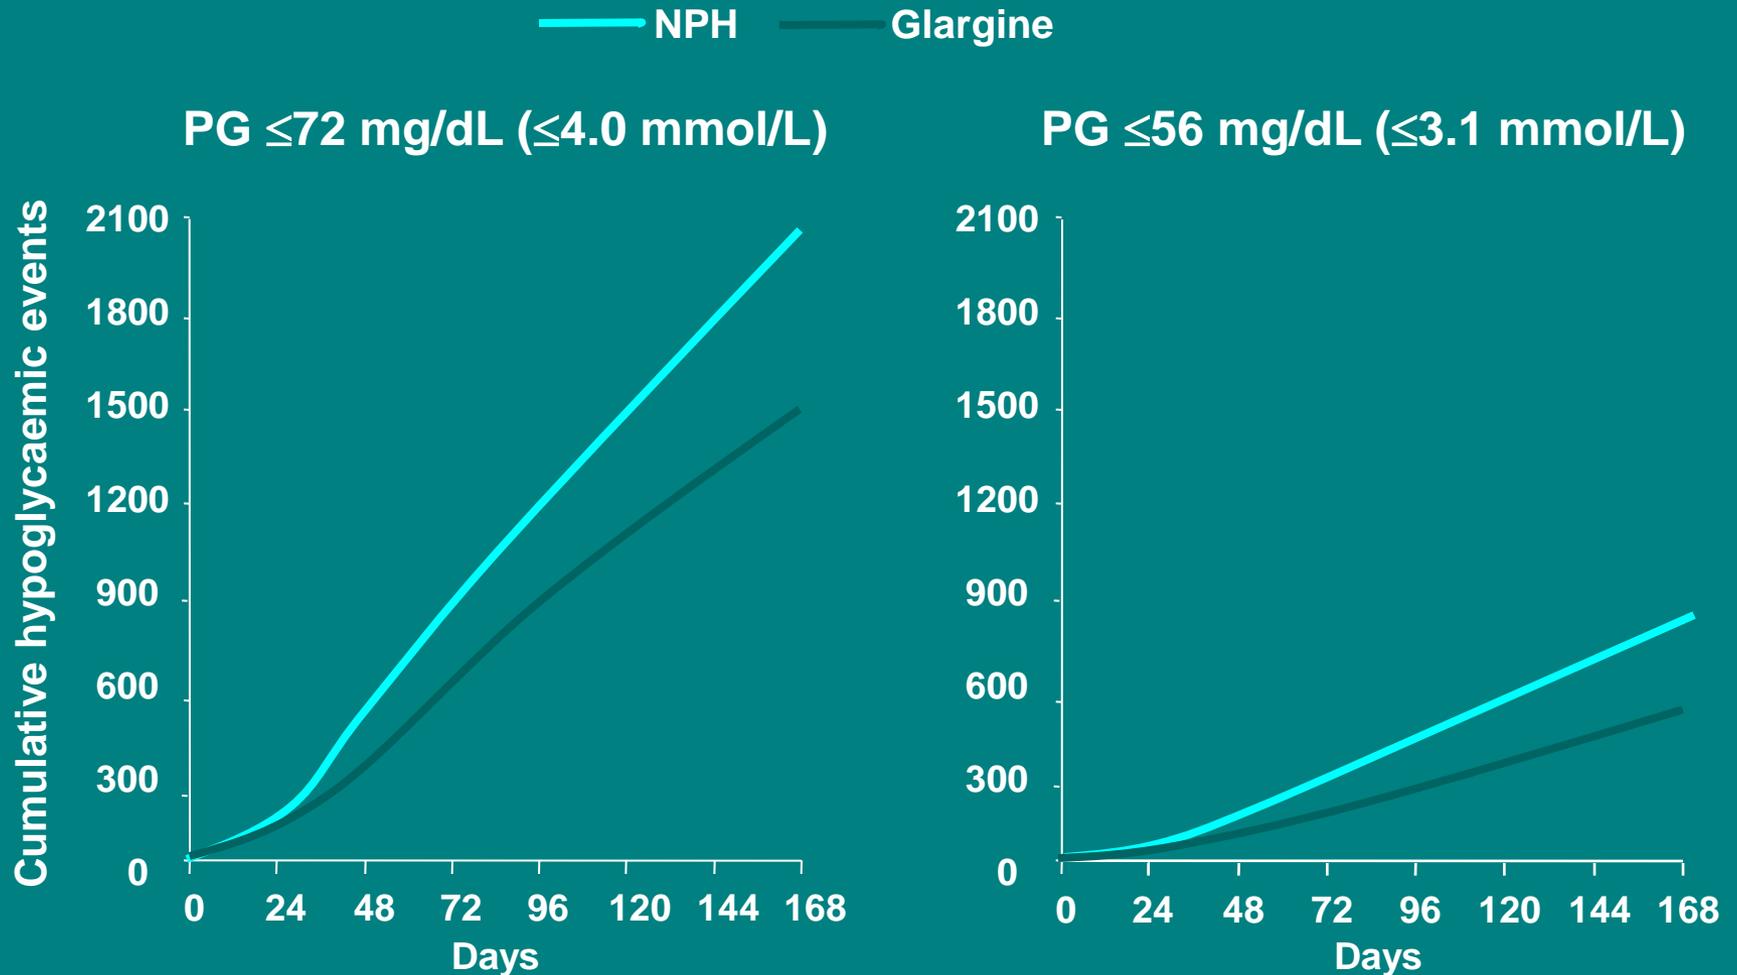

PG=plasma glucose; NPH=neutral protamine Hagedorn.

Adapted from Riddle M et al. *Diabetes Care*. 2003;26:3080-3086.

# Sustained FPG Reductions Are Achieved During Study With Insulin Glargine and NPH Insulin

# Incidence of Hypoglycaemia With Insulin Glargine vs NPH Insulin

# Hypoglycaemic Events With Insulin Glargine vs NPH Insulin

No. of Hypoglycaemic Events per PY	Glargine	NPH	<i>P</i> Value	Relative Risk Reduction, %
All symptomatic	13.9	17.7	<0.02	21
Confirmed ≤4 mmol/L (≤72 mg/dL)	9.2	12.9	<0.005	29
Confirmed ≤3.1 mmol/L (≤56 mg/dL)	3.0	5.1	<0.003	41

# Nocturnal Hypoglycaemic Events With Insulin Glargine vs NPH Insulin

No. of Nocturnal Hypoglycaemic Events per PY	Glargine	NPH	<i>P</i> Value	Relative Risk Reduction, %
All nocturnal symptomatic	4.0	6.9	<0.001	42
Confirmed nocturnal $\leq 4$ mmol/L (72 mg/dL)	3.1	5.5	<0.001	44
Confirmed nocturnal $\leq 3.1$ mmol/L (56 mg/dL)	1.3	2.5	<0.002	48

# Glargine-T2DM in Wycombe

- October 2003-until October 2004
- 105 people with **T2 DM** (77 male, 83 Caucasian, 20 South-Asian, 2 other ethnicity)
- 75 (77%) were treated with **GLAR+MET**
- Sulphonylurea **SU** agents 88 (84%), thiazolidinediones **TZD** 22(21%), and Repaglinide/Nateglinide **MEG** 6 (7%) were stopped
- **GLAR** monotherapy in 20 (23%).

# Methods

- Group starts of 6-10 in Wycombe Diabetes Centre
- 4 times 2 hour group session with DSN, and 30 minutes with dietician
- Translator group for SA patients (Urdu/Punjabi)
- Minimum of 4 telephone contacts for dose titration
- Requested 4 point SBGM 3 times weekly
- TTT titration protocol
- No additional measurements or questionnaires

# Mild hypoglycaemic episodes

# Glycaemic control in T2DM following Glargine treatment

# HbA1c

# Target achieved?

	HbA1c < 7%	HbA1c < 7.5%
6 months (%)	15%	33%
6 months (n=89)	13	29
12 months (%)	19%	42%
12 months (n=69)	13	26

# Achieving target?

## Starting HbA1c < 9%

	HbA1c < 7%	HbA1c < 7.5%
12 months (%) n=41	17%	30%

# Number of doses of insulin aspart

		<i>n</i>	%
Number of doses of insulin aspart	<b>0</b>	<b>50</b>	<b>56%</b>
	<b>1</b>	<b>17</b>	<b>19%</b>
	<b>2+</b>	<b>22</b>	<b>25%</b>

# Conclusions

- Similar falls in blood glucose and HbA1c as TTT/Lanmet
- Similar weight gain and hypoglycaemia as TTT/Lanmet
- However most patients not at target
- Prandial insulin frequently required
- Group starts seem as effective as individual tuition
